1. DIFFERENTIAL EQUATIONS

STUDY MATERIAL

★ **Differential equation:** An equation involving differentials or one dependent variable and its derivatives with respect to one or more independent variables is called a differential equation.

★ **Ordinary differential equation:** A differential equation is said to be ordinary if the derivatives in the equation have reference to only a single independent variable.

Ex: 1. $\left(\frac{dy}{dx}\right)^3 - 4\left(\frac{dy}{dx}\right)^2 + 7y = \cos x$

2. $\frac{d^2y}{dx^2} + 5x\left(\frac{dy}{dx}\right)^2 - 6y = \log x$

★ The general form of an ordinary differential n is

$$F(x, y, \frac{dy}{dx}, \frac{d^2y}{dx^2}, \dots, \frac{d^ny}{dx^n}) = 0$$

$$F(x, y, y^1, y^2, \dots, y^n) = 0$$

★ **Partial differential equation:** A differential equation is said to be partial if the derivatives in the equation have reference to two or more independent variables.

Ex: 1. $(y+z) \frac{\partial z}{\partial x} + (z+x) \frac{\partial z}{\partial y} = x + y$

2. $4 \frac{\partial^2 u}{\partial x^2} + 2 \frac{\partial^2 u}{\partial x \partial y} + \frac{\partial^2 u}{\partial y^2} = x - y$

★ **Order of a differential equation:** A differential equation is said to be of order n, if the nth derivative is the highest derivative in that equation.

★ **Degree of a differential equation:**

Let $F(x, y, y^1, \dots, y^n) = 0$ be a differential equation of order n. If the given differential equation is a polynomial in y^n , then the highest degree of $y^{(n)}$ is defined as the degree of the differential equation.

Ex: a $\frac{d^2y}{dx^2} = \left[1 + \left(\frac{dy}{dx}\right)^2\right]^{\frac{3}{2}}$

The order and degree of this equation is 2.

★ **General Solution of a differential equation:**

Let $F(x, y, y^{(1)}, y^{(2)}, \dots, y^{(n)}) = 0$ be a differential equation of order n. If $\phi(x, y, c_1, c_2, \dots, c_n) = 0$

where c_1, c_2, \dots, c_n are n independent arbitrary constants, is a solution of the given differential equation, then it is called the general solution of the given differential equation.

★ **Particular solution of a differential equation:**

The solution obtained by giving particular values to arbitrary constants in the general solution of the differential equation $F(x, y, y^{(1)}, \dots, y^{(n)}) = 0$ is called a particular solution of given differential equation.

★ **Singular solution of a differential equation:**

An equation $\psi(x, y) = 0$ is called singular solution of the differential equation $F(x, y, y^{(1)}, \dots, y^{(n)}) = 0$ if

- $\psi(x, y) = 0$ is a solution of the given differential equation.
- $\psi(x, y) = 0$ does not contain arbitrary constant and
- $\psi(x, y) = 0$ is not obtained by giving particular values to arbitrary constants in the general solution.

★ An equation of the form $\frac{dy}{dx} = f(x, y)$ is called a differential equation of the first order and of the first degree.

★ The following four methods for solving $\frac{dy}{dx} = f(x, y)$

- Variable separable
- Homogeneous equations and equations reducible to homogeneous form.
- Exact equations and which can be made exact by the use of integrating factors
- Linear equations and Bernoulli's form.

★ **Existence and uniqueness theorem:** Let S

denote the rectangular region defined by $|x - x_0| \leq a$ and $|y - y_0| \leq b$, a region with the point (x_0, y_0) as its centre. If $f(x, y)$ and $\frac{\partial f}{\partial y}$ are continuous functions of x and y in a region S of the xy-plane and if $P(x_0, y_0) \in S$, then there exists one and only one function say $\phi(x)$, which in some neighbourhood of P, is

solution of the differential equation $\frac{dy}{dx} = f(x, y)$ and is such that $\phi(x_0) = y_0$.

★ **Homogeneous Factors:** A function $f(x, y)$ is said to be a homogeneous function of degree n in x and y if $f(kx, ky) = k^n f(x, y) \forall k, n$ is a constant.

★ **Homogeneous differential equation:** A differential equation $\frac{dy}{dx} = f(x, y)$ of first order and first degree is called homogeneous in x and y if the function $f(x, y)$ is a homogeneous function of degree zero in x and y .

★ **Non-Homogeneous equation of the first degree in x and y :** The equation $\frac{dy}{dx} = f(x, y)$ can be

written as $M(x, y) dx + N(x, y) dy = 0$ (or) $N(x, y) \frac{dy}{dx} = M(x, y)$, if $a_1, b_1, c_1, a_2, b_2, c_2$, are constants and $c_1 \neq 0$ or $c_2 \neq 0$ then $(a_2 x + b_2 y + c_2) \frac{dy}{dx} = a_1 x + b_1 y + c_1$ is called a non-homogeneous differential equation of the first degree in x and y .

★ **Exact differential equation:**

Let $M(x, y) dx + N(x, y) dy = 0$ be a first order and first degree differential equation where M, N are real valued functions defined for some real x, y on some rectangle $R: |x - x_0| \leq a, |y - y_0| \leq b$. Then the equation $M dx + N dy = 0$ is said to be an exact differential equation if there exists a function $f(x, y)$ having continuous first partial derivatives in R such that

$$\frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy = M dx + N dy.$$

★ If $M(x, y), N(x, y)$ are two real valued functions which have continuous first partial derivatives on some rectangle $R: |x - x_0| \leq a, |y - y_0| \leq b$, then a necessary and sufficient condition for the differential equation $M dx + N dy = 0$ to be exact in R , is

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x} \text{ in } R.$$

★ **Integrating Factors:** Let $M(x, y) dx + N(x, y) dy = 0$ be not an exact differential equation. If $M dx + N dy = 0$ can be made exact by multiplying it with a suitable function $\mu(x, y) \neq 0$ then $\mu(x, y)$ is called an integrating factor of $M dx + N dy = 0$.

★ **Method to find integrating factors.**

i. $d(xy) = x dy + y dx$

ii. $d(x/y) = \frac{y dx - x dy}{y^2}$

iii. $d(y/x) = \frac{x dy - y dx}{x^2}$

iv. $d\left(\frac{x^2 + y^2}{2}\right) = x dx + y dy$

v. $d\left[\log\left(\frac{y}{x}\right)\right] = \frac{x dy - y dx}{xy}$

vi. $d\left[\tan^{-1}\left(\frac{y}{x}\right)\right] = \frac{x dy - y dx}{x^2 + y^2}$

vii. $d\left[\log\sqrt{x^2 + y^2}\right] = \frac{x dx + y dy}{x^2 + y^2}$

viii. $d\left(\frac{e^x}{y}\right) = \frac{y e^x dx - e^x dy}{y^2}$

ix. $d\left(\frac{x^2}{y}\right) = \frac{2y x dx - x^2 dy}{y^2}$

x. $d(y^2/x) = \frac{2xy dy - y^2 dx}{x^2}$

★ $M(x, y) dx + N(x, y) dy = 0$ is a homogeneous differential equation and $Mx + Ny \neq 0$ then $\frac{1}{Mx + Ny}$ is an integrating factor of $M dx + N dy = 0$.

Note: If $M_x + N_y = 0$ then $M/N = y/x$, then the equation $mdx + ndy = 0$ reduces to $y dx - x dy = 0$ and its solution is $x/y = c$.

★ If the equation $M dx + N dy = 0$ is of the form $y f(xy) dx + x g(xy) dy = 0$ and $Mx - Ny \neq 0$ then $\frac{1}{Mx - Ny}$ is an integrating factor of $M dx + N dy = 0$.

★ If there exists a continuous single variable function $f(x)$ such that $\frac{\partial M}{\partial y} - \frac{\partial M}{\partial x} = N f(x)$ then $e^{\int f(x) dx}$ is an integrating factor of $M dx + N dy = 0$.

Note: 1. $\frac{1}{N} \left(\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x} \right)$ is a function of x alone

2. $e^{\int f(x) dx} = f(x)$ and $e^{\log x^k} = x^k$ where k is constant.

★ If there exists a continuous and differential single variable function $g(y)$ such that $\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} = M g(y)$.

Then $\int g(y) dy$ is an integrating factor of $M dx + N dy = 0$.

★ **Linear differential equations of first order:** An equation of the form $\frac{dy}{dx} + P(x)y = Q(x)$ where $P(x)$ and $Q(x)$ are defined over an interval I , is called a linear differential equation of first order in y .

If $Q(x) = 0$ for all x in I then the corresponding equation $\frac{dy}{dx} + P(x)y = 0$ is called a homogeneous linear equation of first order. If $Q(x) \neq 0$ for some x in I ,

then $\frac{dy}{dx} + P(x)y = Q(x)$ is called a non homogeneous linear equation of first order.

★ If P and Q are differentiable functions of x over an interval I then $y \exp(\int P dx) = \int (Q \exp(\int P dx)) dx + c$ is the general solution of the equation $\frac{dy}{dx} + Py = Q$.

★ **Bernoulli's equation:** An equation of the form $\frac{dy}{dx} + Py = Qy^n$ is called Bernoulli's equation if P, Q are continuous functions of x on an interval I and n is a real number.

★ **Equations reducible to first order and first degree by $p = \frac{dy}{dx}$ substitution:** Consider the

differential equation $f\left(\frac{d^2y}{dx^2}, \frac{dy}{dx}, x\right) = 0$ not containing y directly.

By putting $\frac{dy}{dx} = p$ the equation can be transformed

as $F\left(\frac{dp}{dx}, p, x\right) = 0$ which is of first order and first degree.

★ An equation of the form $f(x, y, p) = 0$, where p is not of first degree, is called a differential equation of first order and not of first degree. An equation of the form $p^n + p_1(x, y)p^{n-1} + \dots + p_{n-1}(x, y)p + p_n(x, y) = 0$ is called the general first order equation of degree n (>1).

★ **Clairaut's equation:** Differential equation of the form $y = px + \phi(p)$ is called Clairaut's equation.

★ **Orthogonal trajectory:** A curve which cuts every member of a given family of curves at a right angle is called an orthogonal trajectory of the given family.

★ The integral curves of the differential equation $F(x, y, -1/y^1) = 0$ are the orthogonal trajectories of the family or integral curves of $F(x, y, y^1) = 0$.

★ If $f(r, \theta, c) = 0$, c being the parameter is the polar equation of the family of curves, then the differential equation of the family of its orthogonal trajectories is $F\left(r, \theta, -r^2 \frac{d\theta}{dr}\right) = 0$.

★ An equation of the form

$$\frac{d^n y}{dx^n} + P_1(x) \frac{d^{n-1} y}{dx^{n-1}} + P_2(x) \frac{d^{n-2} y}{dx^{n-2}} + \dots + P_n(x) y = Q(x).$$

Where $P_1(x), P_2(x), \dots, P_n(x)$ and $Q(x)$ are all continuous and real valued functions of x on an interval

I, is called a linear differential equation of order n.

Ex: 1. $\frac{d^3 y}{dx^3} + x^3 \frac{d^2 y}{dx^2} + x^2 \frac{dy}{dx} + 2x y^2 = \cos x$

★ **Differential operator:** Let the differential operator $\frac{d}{dx}$ be denoted by D and the differential operators

$$\frac{d^2}{dx^2}, \frac{d^3}{dx^3}, \dots, \frac{d^n}{dx^n}$$

be denoted by D^2, D^3, \dots, D^n when applied on function y of x yield.

$$Dy = \frac{dy}{dx}, D^2y = \frac{d^2y}{dx^2}, D^ny = \frac{d^ny}{dx^n}.$$

The polynomial $D^n + P_1 D^{n-1} + P_2 D^{n-2} + \dots + P_n$ in D is called a differential operator of order n and it is denoted by $f(D)$. $f(D) = D^n + P_1 D^{n-1} + P_2 D^{n-2} + \dots + P_n$.

★ An equation of the form

$$\frac{d^ny}{dx^n} + P_1 \frac{d^{n-1}y}{dx^{n-1}} + \dots + P_n(y) = Q(x).$$

Where P_1, P_2, \dots, P_n are real constants and $Q(x)$ is a continuous function of x defined on an interval I, is called a linear equation of order n with constant coefficients.

★ If $f(D) = D^n + P_1 D^{n-1} + P_2 D^{n-2} + \dots + P_n$

where P_1, P_2, \dots, P_n are real constants, then $f(D)e^{mx} = f(m)e^{mx}$ where m is a constant.

★ If m_1 is a root of the equation $f(m) = 0$ then $y = e^{m_1 x}$ is a solution of $f(D)y = 0$.

★ If $f(D) = D^n + P_1 D^{n-1} + \dots + P_n$ where P_1, P_2, \dots, P_n are real constants then $e^{mx} [f(D)y] = f(D-m) e^{mx} y$. Where y is a function of x.

★ **Auxillary equation of $f(D)y=0$:** The algebraic equation $f(m) = 0$ i.e. $m^n + P_1 m^{n-1} + \dots + P_n = 0$. Where P_1, P_2, \dots, P_n are real constants is called the auxillary equation of $f(D)y = 0$.

Note: $c_1 e^{m_1 x} + c_2 e^{m_2 x} + \dots + c_n e^{m_n x}$ is the complementary functions of $f(D)y = Q(x)$.

★ **Inverse operator:** The operator D^{-1} is called the inverse of the differential operator D.

★ If Q is a function of x defined on an interval I, then $\frac{1}{f(D)} Q$ is also some function of x, containing no

arbitrary constant. When f(D) operates on this function, the result is the function Q.

★ If Q is any function of x defined on an interval I and α is a constant, then a particular value of $\frac{1}{D-\alpha} Q$ is equal to $e^{\alpha x} \int Q e^{-\alpha x} dx$.

★ If $\frac{1}{D-\beta}, \frac{1}{D-\alpha}$ are two inverse operators then we

- ★ If $p < a < q$ and $\delta = \min\{|a-p|, |a-q|\}$
- ★ **Finite and Infinite subsets of R:** A non-empty subset S of R is said to be finite if there exists a bijective function.
Ex: Q is considered to be a finite set. A subset of R which is not finite is called infinite set.
 Z^+ , Z , Q , R are infinite sets.
- ★ **Boundedness of subsets of R Aggregate:**
A non-empty subset A of R is called an aggregate.
- ★ **Upper Bound:** A subset S of R is said to be bounded above if there exists $k_1 \in R$, such that $x \in S \Rightarrow x \leq k_1$. The number k_1 is called an upper bound of S .
- ★ **Least upper bound or supremum:** If ' u ' is an upper bound of an aggregate ' S ' and any real number less than ' u ' is not an upper bound of S , then ' u ' is called least upper bound (or) supremum of (S) (l.u.b).
- ★ **Lower bound:** An aggregate S is said to be bounded below, if there exists $k_2 \in R$ such that $x \in S \Rightarrow x \geq k_2$. The number k_2 is called a lower bound of S .
- ★ **Greatest lower bound or infimum:** If ' v ' is a lower bound of an aggregated ' S ' and any real number greater than ' v ' is not a lower bound of S , then ' v ' is called greatest lower bound (g.l.b) or infimum of S .
Note: Supremum is defined only for the aggregates which are bounded above and infimum is defined only for the aggregates which are bounded below.
- ★ If an aggregate is bounded above and supremum exists, then it is unique.
- ★ **Boundedness:** An aggregate ' S ' is said to be bounded if it is both bounded below and bounded above.
- ★ The aggregate S is bounded \Leftrightarrow there exist u and $v \in R$ such that $v \leq x \leq u$ for all $x \in S$, or

If the infimum of an aggregate ' S ' is a member of S , then it is called the least member of S .
The greatest member of an aggregate ' S ' is the supremum. But the supremum of ' S ' need not be the greatest member.
- Note:** i. A bounded aggregate ' S ' need not have the greatest or the least member.

 - ii. Order axioms
 - iii. Completeness axioms and hence ' R ' is a complete ordered field.
- ★ Let A, B two non-empty subsets of ' R ' such that $(a \in A \Rightarrow a \leq b \forall b \in B)$. If B has supremum then ' A ' has supremum and $\sup A \leq \sup B$.
- ★ The set Z^+ of positive integers is unbounded above.
- ★ For every real number x there is a positive integer n such that $n > x$.
- ★ **Dedekind's theorem:** If L, U are two subsets of ' R ' such that

 - ii. $L \cup U = R$ (each real number is either in ' L ' or in ' U ')
iii. $x \in L, y \in U \Rightarrow x < y$ (each member of ' L ' is smaller than every member of U)

- ★ **Archimedian property:** If $x, y \in R$ and $x > 0$, there exists $n \in Z^+$ such that $nx > y$.
- ★ For every $x \in R^+$, there exist $m, n \in Z$ such that $m < x < n$.
- ★ For every $x \in R$, there exists unique $n \in Z^+$ such that $n \leq x < n+1$, i.e., every real number lies between two consecutive integers.
